

Hair Evidence

Parts of the Hair

Medulla Types

Medulla Patterns

Uniserial-
cats

Multiserial-
rabbits

Vacuolated-
dogs

- deer

Amorphous-
humans

Cuticle Types

Coronal

Mouse
(nonhuman)

Imbricate

human

Spinous

cat

Medullary Index

- Width of the medulla/ width of the hair shaft
- If it is less than $1/3$, it is human

Observe Cuticle

- Type of cuticle
- Is this **possibly** human?
- Damaged or undamaged

Cortex

- Contains pigment granules.
- **Pigment** distribution
 - **Dyed** hair
 - **Undyed** hair
- UNDEVELOPED OR MISSING pigments cause grey hair

Proximal End

- End nearest torso
- Root or no root?

Distal End

- End farthest from the torso

So How Do We Use Hair?

- Must look for special features
- Ex: Dyeing can leave lines where the hair has grown
- Ex: The tip of the hair can tell whether the individual has had a recent hair cut

Questions About Hair

- All hair **on one head** the same?
- Different on different body areas?
- Tell **race** of person from hair?
- **Sex** of person from hair?
- **Age** of person from hair?

Is it a Match?

- What makes a match? All the **characteristics** found on the known hair and the questioned hair must be identical.
- What does it mean to say they “match”?
 - **Class**
 - **INDIVIDUAL**

Matching Hair

- Hair has basically **class characteristics**
 - Matching distribution of pigment, medulla type and cuticle type can be found in many individuals.
- Cellular material present
DNA???

Hair Collection

- Cellophane **tape** into Petri dish or
- **Vacuuming**
- Choose container that will **prevent loss**
- Label and
- Seal
- Receipt for evidence!!!

Control Samples

- Determine the source of evidence
- Uncontaminated
- From known source
- For hair-must be pulled
 - 50 from all over head
 - 24 from pubic area in case of sexual assault

Problems with using hair characteristics in criminal cases

- HAIR IS NOT UNIFORM!
- Hair is taken from different parts of the scalp.
- Even this is not enough, usually
- Even different parts on the same hair can look very different!

Fibers

**Collection, Testing and
Determination of
Uniqueness**

image from www.fbi.gov

Types of Fiber

- **Natural-**

- Any fiber that comes from plant or animal sources, examples?

- Image of cotton fibers from www.fbi.gov

Types of Fibers Cont'd

- **Synthetic-**
 - Any fiber that is made in a laboratory, examples?

- Image of nylon from www.fbi.gov

Testing

- Fibers are generally identified by type of cloth and color by
- Physical Properties
 - Burn test
 - Melting test
 - Solubility
 - Optical properties
 - Dye identification

Burning and Melting Tests

- Place the fiber in a flame and record the results.
- Heat the fiber on a hotplate and record the results.
- Changes in physical properties: color, smoke, smell, etc.

Solubility Test

- What is it soluble in?

- Strong base

- Strong acid

- other

Optical Properties

- Behavior in
 - visible,
 - IR,
 - UV and
 - polarized light

- Image from www.usgs.gov/

Identification of Dye

- Thin Layer Chromatography
 - Separates molecules based on the affinity to the surface they are placed on versus their solubility in the solvent they are being dissolved in
 - Low solubility in solvent and high adhesion to the surface--- does not go very far

- Image from www.dps.state.ia.us

Is it a Match?

- What makes a match? All the *characteristics* found on the known fiber and the questioned fiber *must be identical*.
- What does it mean to say they “match”?
 - Class
 - Individual

CHARACTERISTICS

Individual

Class

- Unique enough to be linked to one individual.
- Matches a group

One of a kind? Very unusually made fiber made in very small amount with unusual dye

Or pieced into a cloth like a puzzle piece.

Fiber Collection

- Cellophane **tape** into Petri dish or
- **Vacuuming**
- Choose container that will **prevent loss**
- Label and
- Seal

Control Samples

- From victim & suspects' homes and vehicles
- Uncontaminated
- Large enough to do testing needed
